Ahmed Abdi

Software Engineer
Malaysia | +60 11 6082 6697 | ahmadmohabdi@gmail.com | https://www.linkedin.com/in/ahmed-abdi-l

SUMMARY

Software engineer with 4 years delivering **backend** and **full-stack** systems from requirements and design through testing, deployment and production support. Built customer wallets, financial ledgers and **APIs**, and contributed to a monolith-to-**microservices** migration. Work with **TypeScript/Node.js, Python and SQL, Laravel, Java**. Including **AI** tools with deterministic verification and automated tests. Refine systems through stakeholder feedback, with a focus on correctness, security and maintainable code.

EXPERIENCE

Senior Software Engineer Remote | Feb 2024 – Jul 2026
Towfiq Welfare Society
· 200-staff organisation, in-house engineering team

- Led a team of engineers delivering a unified accounting, HR and operations platform in **Laravel** and **PostgreSQL**
- Designed the relational data model and owned the platform from schema through deployment and production support
- Eliminated the manual spreadsheet close with an **ACID double-entry ledger** that commits every posting as one balanced unit, reconciling **1,000+ transactions** monthly with automatic trial balances
- Enforced **segregation of duties** across three permission tiers with role-gated access and a two-stage approval workflow, deriving record state from independent per-tier approvals, not one status field
- Made every financial transaction and user action **traceable end to end** by designing the audit trail and log aggregation
- Kept query performance stable as data grew with a monthly job separating **hot transactional** from **cold archival** records

Senior Software Engineer (Contract) Malaysia | Oct 2023 - Dec 2023
Kollect System
· Fintech, payments and financial management for enterprise clients

- Built and documented **15+ secure REST APIs** in **Python/FastAPI** and psycopg for web and mobile clients, agreeing contracts directly with frontend, mobile and product teams
- Cut a latency-critical payments endpoint from **450ms to 220ms (51%)** by rewriting PostgreSQL queries and adding Redis caching
- Delivered the backend workstream of a **monolith-to-microservices** migration, defining service boundaries and API contracts
- Raised test coverage to **80%** by building **GitHub Actions** CI/CD with quality gates on unit and integration tests
- Made services observable with centralised **structured logging** and health-check endpoints, and ran team code reviews

Software Engineer Saudi Arabia | Oct 2021 - Jan 2023
NOUL
· High-traffic e-commerce platform, GCC region

- Built and maintained high-availability backend APIs in **Java/Spring Boot** and MySQL serving **500,000+ monthly active users**
- Built the customer **wallet system**, keeping balances correct across every credit and debit with transactional writes
- Cut average query latency **~30%** through MySQL optimisation and refactoring of hot paths, holding up at peak load
- Implemented authentication and authorisation end to end: credential management, token lifecycle and **RBAC** policies
- Removed manual operational overhead by automating internal **data pipelines** and business workflows
- Handled maintenance, troubleshooting and production support for live, customer-facing services

EDUCATION

Master of Software Engineering - University of Malaya, Malaysia 2024 - Current
Thesis: Framework for Measuring Web and UI Technical Skills in Open Source project.

Bachelor of Computer Science - Umm Al-Qura University, Saudi Arabia 2015 - 2020

PROJECTS

Ledger-MCP github.com/ahmadadam97/ledger-mcp - Python · Pydantic · SQLite · MCP · Anthropic API
MCP server exposing a double-entry ledger as agent-callable tools. Found value constraints and the integer-cent invariant lived only in docstrings and moved them into the JSON schema.
FinVerify github.com/ponli550/DevLeague - Python · LLM pipelines · CI gating
AI financial-report analyser: the model proposes figures, Python recomputes every one before release. Led four engineers at Experian DevLeague; caught a planted RM 100k discrepancy on stage.
Event Ticketing github.com/ahmadadam97/Event-Ticketing - Next.js · Node.js · PostgreSQL
Venue booking platform with concurrency-safe seat reservation under contention. 85% test coverage.

TECHNICAL SKILLS

Languages: Java, Python, SQL, PHP, TypeScript, Go
Backend: Spring Boot**,** FastAPI, Laravel, Node.js, REST APIs, Microservices, Distributed Systems, System Design
Data: PostgreSQL, MySQL, Redis, SQLite, Data Modelling, Query Optimisation, ACID Transactions
Infrastructure: Docker, CI/CD, GitHub Actions, Git, Linux/Unix · AWS and Kubernetes (working knowledge, non-production)
AI Engineering: MCP servers, tool-schema design, eval harnesses, strict-JSON LLM pipelines, Anthropic SDK, test-first delivery
